

PUEBLO COMPUTER SYSTEMS, INC.

Create Records

(Without leaving home)

The concept is based on creating a Relationship from the Parent Table (Customer), using a global field, to the Child table (Contacts) primary key. I call the global field in the parent table zgCR_Nav

Script...

First clear the global

Set Field [Customer::zg_CR_Nav ; ""]

Using the CR_Nav Relationship Set the CustomerID in the Contact Record. You will see that the Global gets the ID from the contact record.

Set Field [Customer_Contacts|CR_Nav::CustomerID ; Customer::CustomerID]

Commit Records/Request []

Go To Field [Customer_Contacts|CustomerID::ContactName]

Go To Portal Row [Last]

Go To Field [Customer_Contacts|CustomerID::ContactName]

That's the general idea. After the commit you can set any number of additional fields. Just end them with a commit.
